Disclaimer

This document is an exam summary that follows the slides of the *Reliable and Interpretable Artificial Intelligence* lecture at ETH Zurich. The contribution to this is a short summary that includes the most important concepts, formulas and algorithms. This summary was created during the fall semester 2020. Due to updates to the syllabus content, some material may no longer be relevant for future versions of the lecture. This work is published as CC BY-NC-SA.

I do not guarantee correctness or completeness, nor is this document endorsed by the lecturers. Feel free to point out any erratas. For the full LATEX source code, consider github.com/ymerkli/eth-summaries.

```
Cauchy Schwarz: \langle x, y \rangle \leq ||x||_2 \cdot ||y||_2
                                                                  prox. through NN via bound propagation.
1.2 Abstract Interpretation
                                                                  Box: \hat{x_i} = [l, u], i.e. l \leq x_i \leq u.
Symbolic shape z semantically represents a set
of concrete values x = \gamma(z). Concretization \gamma:
defines the concrete values an abstract element
                                                                 ReLU^{\#}[a,b] = [ReLU(a), ReLU(b)];
z represents. Concrete transformer F(\cdot) (F(x))
                                                                 \lambda \cdot \# [a, b] = [\lambda a, \lambda b] \ (\lambda > 0)
generally uncomputable), abstract transformer
F^{\#}(\cdot), F^{\#}(z) applies abstract transformer to z
Soundness: F^{\#} needs to over-approximate F:
\gamma(F^{\#}(z)) \supset F(x) = F(\gamma(z))
                                                                  \vec{a}_0 = [a_0^1, ..., a_0^d].
F^{\#} soundness: \forall z : F(\gamma(z)) \subseteq \gamma(F^{\#}(z))
F^{\#} exactness: \forall z : F(\gamma(z)) = \gamma(F^{\#}(z))
F_{best}^{\#} optimality: \forall z : \gamma(F^{\#}(z)) \not\subset \gamma(F_{best}^{\#}(z)).
                                                                  |Y - \vec{a}_0|. \mathcal{Z} is point-symmetric around \vec{a}_0.
2 Adversarial Attacks
                                                                  AT^{\#}: Affine \# is exact
T-FGSM: x' = x - \eta, \ \eta = \epsilon \cdot sign(\nabla_x loss_t(x))
U-FGSM: x' = x + \eta, \ \eta = \epsilon \cdot sign(\nabla_x loss_s(x))
                                                                 (a_0^p + a_0^q) + \sum_{i=1}^k (a_i^p + a_i^q) \epsilon_i
Guarantees \eta \in [x - \epsilon, x + \epsilon], \eta not minimized.
C&W: Find adv sample x' = x + \eta \in [0,1]^n
and minimize ||\eta||_p via relaxation s.t. f(x') = t.
obj_t: obj_t(x+\eta) \le 0 \Leftrightarrow f(x+\eta) = t.
Minim. ||\eta||_p + c \cdot obj_t(x + \eta) s.t. x + \eta \in [0, 1]^n
E.g. obj_t = \{CE(x',t) - 1; max(0,0.5 - p_f(x')_t)\}
\nabla_{\eta} ||\eta||_{p} is suboptimal \rightarrow use proxy
l_{\infty}: proxy L(\eta) = \sum_{i} max(0, |\eta_i| - \tau). Iterative-
                                                                 b_i = \lambda a_i, \forall i \in [1, k], b_{k+1} = -\lambda l_x/2,
ly decrease \tau until L(\eta) > 0. Then do GD on
                                                                  with \lambda = u_x/(u_x - l_x)
\eta: \eta = \eta - \gamma \nabla_{\eta} (L(\eta) + c \cdot obj_t(x + \eta)) until
L(\eta) = 0, then anneal \tau and continue loop.
Constraint \eta_i \in [-x_i, 1-x_i]: LBFGS-B, PGD
                                                                  discussed here is optimal area-wise.
PGD: Iterative FGSM with projection to find
point in x_0 \pm \epsilon that max. loss.
                                                                  DeepPoly: For each x_i keep:
1. Init x' = x + \epsilon \cdot rand[-1, 1];
                                                                  • interval constraints l_i \leq x_i, x_i \leq u_i
2. Repeat: x' \leftarrow x' + \epsilon_{step} \cdot sgn(\nabla_{x'}loss_s(x'))
(untargeted) or x' \leftarrow x' - \epsilon_{step} \cdot sgn(\nabla_{x'} loss_t(x'))
(targeted); x' = project(x', x_o, \epsilon);
                                                                 AT^{\#}: Affine ^{\#} is exact
Diffing Networks: find x that diffs 2 networks
while (class(f_1(x)) = class(f_2(x))):
   x = x + \epsilon \nabla_x obj_t(x); //obj_t(x) = f_1(x)_t - f_2(x)_t \sum_i (w_i^p + w_i^q) \cdot x_i + (\nu^p + \nu^q);
```

3 Adversarial Defenses

 $\mathbb{E}_{(x,y)\sim D} \left| \max_{x'\in S(x)} L(\theta, x', y) \right|,$

 $\arg \max_{x' \in S(x)} L(\theta, x', y), \forall (x, y) \in B$

 $S(x) = \{x' : ||x - x'||_{\infty} \le \epsilon\}$

PGD Defense in practice:

TRADES defense:

Defense as Optimization: $\min_{\theta} \rho(\theta), \ \rho(\theta) =$

1. Select mini batch B from D 2. $x_{max} =$

3. $\theta' = \theta - \frac{1}{|B_{max}|} \sum_{(x_{max}, y) \in B_{max}} \nabla_{\theta} L(\theta, x_{max}, y)$

1 Basics

1.1 Good to know

 $||x||_p = \left(\sum_{i=1}^d |x_i|^p\right)^{\frac{1}{p}}$

Tangent at (t, f(t)):

 $t(x) = f'(t) \cdot x + f(t) - f'(t) \cdot t$

Softmax $\sigma(z)_i = e^{z_i} / \sum_{j=1}^D e^{z_j}$

CE loss: $CE(\vec{z}, y) = -\sum_{c=1}^{K} \mathbb{1}[c = y] \cdot \log z_c$ Implication: $\phi \implies \psi \iff \neg \phi \lor \psi$

Mean value: $f(y) = f(x) + \nabla f(z)^T (y - x)$

Line through 2 points: (a, f(a)), (b, f(b)),

Subadditivity of $\sqrt{\cdot}$: $\sqrt{x+y} \le \sqrt{x} + \sqrt{y}$

Gauss: $\mathcal{N} = \frac{1}{\sqrt{(2\pi)^d |\Sigma|}} exp(-\frac{1}{2}(x-\mu)^T \Sigma^{-1}(x-\mu))$

CDF: $\Phi(v; \mu, \sigma^2) = \int_{-\infty}^{v} \mathcal{N}(y; \mu, \sigma^2) dy = \Phi(\frac{v - \mu}{\sqrt{\sigma^2}}; 0, 1)$

a < b: $l(x) = \frac{f(b) - f(a)}{b - a} \cdot x + f(a) - \frac{f(b) - f(a)}{b - a} \cdot a$

 $||x||_{\infty} = \max_{i \in \{1, \dots, n\}} |x_i|$

```
\min_{\theta} \mathbb{E}_{(x,y) \sim D}[L(\theta, x, y) + \lambda \max_{x' \in \mathbb{B}_{\epsilon}(x)} L(\theta, x', f_{\theta}(x))]
                                                                     \mathbf{u_i} > -\mathbf{l_i} : a_i^{\leq} = x_i, \, a_i^{\geq} = \lambda x_i - \lambda l_i, \, x_i \in [l_i, u_i];
4 Certification of Neural Networks
                                                                     Symbolic bound: when proving y_2 > y_1, use
Given NN N, pre-condition \phi, post-condition \psi
                                                                     abstract shape of y_2 - y_1 and prove l_{y_2 - y_1} > 0
 prove: \forall i \in I : i \models \phi \implies N(i) \models \psi or return a
                                                                     4.2 Complete Methods
 violation.
                                                                     Encode NN as MILP instance.
4.1 Incomplete Methods:
                                                                     - Affine: y = Wx + b direct MILP constraint.

```

COLT: PGD training with intermediate NN layer shapes S_i . Iterate over layers h_i and find weights $\bar{\theta}$ for layers $h_{i+1},..,h_D$ that minimize the worst-case loss of $x_i \in S_i$. Weights of previous layers $h_1, ..., h_i$ are frozen.

- $x_i = \text{ReLU}^{\#}(x_i)$: interval constr. $x_i \in [l_i, u_i]$:

 $\mathbf{u_i} \le -\mathbf{l_i} : a_i^{\le} = 0, \ a_i^{\ge} = \lambda x_i - \lambda l_i, \ x_i \in [0, u_i];$

int: backsubstitution up to some layer. Then

replace neurons of that layer with its correct in-

terval constraint (like in Zonotope Box bounds).

Backsub: sum up all components!

 $u_i \leq 0$: $a_i^{\leq} = a_i^{\geq} = 0, l_i = u_i = 0$;

 $l_i < 0, u_i > 0$: $\lambda = u_i/(u_i - l_i),$

 $l_i \ge 0$: $a_i^{\le} = a_i^{\ge} = x_i, l_i = l_i, u_i = u_i$;

Geom. transformation: $T_{\kappa}: \mathbb{R}^2 \to \mathbb{R}^2$. Rotation: $T_{\phi}(x,y) = (x\cos\phi - y\sin\phi, x\sin\phi + y\cos\phi).$

where $I_{\kappa}(x,y) = I \circ T_{\kappa}^{-1}(x,y)$

min max $L(h_D(h_{D-1}(...h_{i+1}(x_i))), y_{true})$ The inner maximization requires projections:

projections on Zonotope solved via projection on Box (via change of variables): $\rightarrow \max_{x \in Z} \dot{L}(x, y_{true}) = \max_{\epsilon \in [-1, 1]^k} \dot{L}(A \cdot \epsilon, y_{true})$ Each $x \in Z$ has a $\epsilon \in [-1,1]^k$ s.t. $x = A\epsilon$. Instead of projecting $x' \notin Z$ onto Z, write $x' = A\epsilon'$

5.2 COLT

and project ϵ' onto $[-1,1]^k$ by $clip(\epsilon',-1,1)$. **6** Geometric Transformation Robustness Many transformations preserve semantic meaning of the original image while not being covered by a small l_p ball.

Translation: $T_{\delta_x,\delta_y}(x,y) = (x + \delta_x, y + \delta_y).$ Scaling: $T_{\lambda}(x,y) = (\lambda x, \lambda y)$ Bilinear Interpolation: $I: \mathbb{R}^2 \to \mathbb{R}^2$ $I(x,y) = p_{x_1,y_1}(x_2 - x)(y_2 - y)$

 $+p_{x_1,y_2}(x_2-x)(y-y_1)+p_{x_2,y_1}(x-x_1)(y_2-y)$ $+ p_{x_2,y_2}(x-x_1)(y-y_1); \text{ where } x_1 \leq x \leq x_2,$ $y_1 \le y \le y_2$ and $x_2 = x_1 + 1, y_2 = y_1 + 1$ Pixel value (x, y) after T_{κ} given by $I_{\kappa} : \mathbb{R}^2 \to \mathbb{R}$

6.1 Certifying geometric robustness Convex relaxation $C(R_{\Phi}(O))$ for exact region $R_{\Phi}(O)$. Use DeepPoly to get sound, tight lower and upper constraints for each pixel:

 $\mathbf{w}_1 \kappa + b_l \leq I_{\kappa}(x, y) \leq \mathbf{w}_{\mathbf{u}} \kappa + b_u, \forall \kappa \in D$ Minimize Volumes via MC approx:

 $L(\mathbf{w}_1, b_l) = \int_{\kappa \in D} I_{\kappa}(x, y) - (\mathbf{w}_1^{\mathbf{T}} \kappa + b_l) d\kappa$ $\approx \frac{1}{N} \sum_{i=1}^{N} I_{\kappa^i} - (\mathbf{w_l^T} \kappa^i + b_l)$

 $U(\mathbf{w_u}, b_u) = \int_{\kappa \in D} (\mathbf{w_u^T} \kappa + b_u) - I_{\kappa}(x, y) d\kappa$ $\approx \frac{1}{N} \sum_{i=1}^{N} (\mathbf{w_u^T} \kappa^i + b_u) - I_{\kappa^i}$

subject to finite set of constraints (LP solve) $\mathbf{w_l^T} \kappa^i + b_l \le I_{\kappa^i}(x, y) \le \mathbf{w_u^T} \kappa^i + b_u, \forall i \in 1, ..., N$ \rightarrow can obtain over-approximations \hat{w}_l , \hat{b}_l , \hat{w}_u , \hat{b}_u Problem: This is only sound at the finite sample

the maximum soundness violation on entire D: lb: $(\hat{\mathbf{w}}_{l}^{\mathbf{T}}\kappa + \hat{b}_{l}) - I_{\kappa}(x,y) \leq \delta_{l}, \forall \kappa \in D$ ub: $I_{\kappa}(x,y) - (\hat{\mathbf{w}}_{\mathbf{u}}^{\mathbf{T}}\kappa + \hat{b}_{u}) \leq \delta_{u}, \forall \kappa \in D$

(Intuition: if $(\hat{\mathbf{w}}_{1}^{\mathbf{T}}\kappa + \hat{b}_{l})$ is unsound, then $\exists \kappa$: $\hat{\mathbf{w}}_{\mathbf{l}}^{\mathbf{T}} \kappa + \hat{b}_{l} > I_{\kappa}(x, y)$, similarly for ub) Then, constraints $\mathbf{w}_l = \hat{\mathbf{w}}_l, b_l = \hat{b}_l - \delta_l$,

Bounding max. violation: compute upper bounds on $f_l(\kappa) = (\hat{\mathbf{w}}_l^T \kappa + \hat{b}_l) - I_{\kappa}(x, y),$ $f_u(\kappa) = I_{\kappa}(x, y) - (\hat{\mathbf{w}}_{\mathbf{u}}^{\mathbf{T}} \kappa + \hat{b}_u)$ • Run box propagation to obtain l, u s.t.

 $f(\kappa) \in [l, u] \to f(\kappa) \le u, \forall \kappa \in D$ • Mean-value theorem, Lipschitz continuity:

 $f(\kappa) = f(\kappa_c) + \nabla f(\kappa')^T (\kappa - \kappa_c) \le f(\kappa_c) +$ $|L|^T(\kappa - \kappa_c) \le f(\frac{1}{2}(h_u + h_l)) + \frac{1}{2}|L|^T(h_u - h_l)$

with $|\partial_i f(\kappa')| \leq |L_i|, \forall \kappa' \in D, D = [h_l, h_u].$ Bound L on $\nabla f(\kappa')$? propagate hyperrectangle D through partial derivative $\partial_i f(\kappa')$ using some convex relaxation.

In practice: branch D into multiple hyperrectangles and bound each separately. 7 Logic and Deep Learning (DL2)

7.1 Querying Neural Networks Use standard logic $(\forall, \exists, \land, \lor, f : \mathbb{R}^m \to \mathbb{R}^n, ...)$ and high-level queries to impose constraints.

 $(class(NN(i)) = 9) = \bigwedge NN(i)[i] < NN(i)[9]$

Use translation T of logical formulas into differentiable loss function $T(\phi)$ to be solved with gradient-based optimization to minimize $T(\phi)$. **Theorem**: $\forall x, T(\phi)(x) = 0 \iff x \models \phi$

Logical Formula to Loss:

Logical Term	Translation
$t_1 \leq t_2$	$\max(0, t_1 - t_2)$
$t_1 \neq t_2$	$[t_1 = t_2]$
$t_1 = t_2$	$T(t_1 \le t_2 \land t_2 \le t_1)$
$t_1 < t_2$	$T(t_1 \le t_2 \land t_1 \ne t_2)$
$\phi \lor \psi$	$T(\phi) \cdot T(\psi)$
$\phi \wedge \psi$	$T(\phi) + T(\psi)$
	$\begin{array}{c} t_1 \leq t_2 \\ t_1 \neq t_2 \\ t_1 = t_2 \\ t_1 < t_2 \\ \phi \lor \psi \end{array}$

Translation is recursive and $T(\phi)(x) > 0, \forall x, \phi$ Box constraints: ineffective in GD. Use L-BFGS-B and give box constraints to optimizer. 7.2 Training NN with Background Knowledge

Incorporate logical property ϕ in NN training.

Problem statement: find θ that maximizes the expected value of property. Maximize $\rho(\theta) = \mathbb{E}_{s \sim D} |\forall z. \phi(z, s, \theta)|$.

BUT: Universal quantifiers are difficult.

Reformulation: get the worst violation of ϕ and find θ that minimizes its effect.

minimize $\rho(\theta) = \mathbb{E}_{s \sim D} |T(\phi)(z_{worst}, s, \theta)|$ where $z_{worst} = \arg\min_{z} T(\neg \phi)(z, s, \theta)$ In practice, restrict z to a convex set with efficient projections (closed form). One can then remove the constraint from ϕ that restricts z on the convex set and do PGD while projecting

8 Randomized Smoothing for Robustness Construct a classifier \mathbf{g} from a classifier \mathbf{f} s.t. \mathbf{g} has certain statistical robustness guarantees.

z onto the convex set.

Given base classifier $f: \mathbb{R}^d \to \mathcal{Y}$, construct 8.2 Inference smoothed classifier g (where $\epsilon \sim \mathcal{N}(\sigma^2 \mathbf{I})$): $q(x) := \arg \max_{c \in \mathcal{V}} \mathbb{P}_{\epsilon}(f(x+\epsilon) = c)$

Robustness Guarantee: suppose $c_A \in \mathcal{Y}$ (most likely class), $p_A, \overline{p_B} \in [0, 1]$ satisfy: $\mathbb{P}_{\epsilon}(f(x+\epsilon)=c_A) \geq p_A \geq \overline{p_B} \geq$

 $\geq \max \mathbb{P}_{\epsilon}(f(x+\epsilon)=c)$

bability and $\overline{p_B}$ an upper bound on the true second highest probability. In practice, get bounds via sampling which gives statistical guarantees. Then: $g(x + \delta) = c_A$, for all $||\delta||_2 < R$, $R := \frac{\sigma}{2}(\phi^{-1}(p_A) - \phi^{-1}(\overline{p_B})) \geq 0$ with ϕ^{-1} the

pends on input x since $p_A, \overline{p_B}$ depend on x.

with p_A a lower bound on the true highest pro-

Notes on CDF: If $x \sim \mathcal{N}(0,1), p \in [0,1],$ then $\phi^{-1}(p) = \nu$ s.t. $\mathbb{P}_x(x \le \nu) = p$. ϕ^{-1} is mo-Base classifier $f: \mathbb{R}^d \to \mathcal{Y}$, image transformatinotone, i.e. for $p_A \geq \overline{p_B}$, $\phi^{-1}(p_A) \geq \phi^{-1}(\overline{p_B})$. $\phi^{-1}(p) = -\phi^{-1}(1-p), p \in [0,1]$ Certified Accuracy: Pick target radius T and

 $R \geq T$ and where the predicted c_A matches the test set label. Standard Accuracy: Instantiate certified accuracy with T=0

count #test points whose certified radius is

8.1 Certification Procedure

function CERTIFY(f, σ ,x, n_0 ,n, α) counts0 \leftarrow SampleUnderNoise(f,x, n_0,σ) $\hat{c}_A \leftarrow \text{top index in counts}0$ counts \leftarrow SampleUnderNoise(f,x,n, σ) $p_a \leftarrow \text{LowerConfBound}(\text{counts}[\hat{c}_A], \text{n}, 1-\alpha)$ return prediction \hat{c}_A , radius $\sigma\phi^{-1}(p_A)$ else: return ABSTAIN

Notes:

- \hat{c}_A is not necessarily the correct test set label - Sample $2 \times (n \gg n_0)$ to prevent selection bias. - SampleUnderNoise evaluates f at $x + \epsilon_i$ for $i \in \{1, ..., n\}$, returns dict of class counts. - LowerConfBound returns probability p_l s.t. $p_l \leq p$ with probability $1-\alpha$, assuming $k \sim$ Binomial(n, p) for unknown p.

- $p_A > \frac{1}{2}$ ensures $\overline{p_B} < \frac{1}{2}$, thus $p_A \leq \overline{p_B}$ - With probability at least $1 - \overline{\alpha}$, if CERTIFY returns class \hat{c}_A and radius $R = \sigma \phi^{-1}(p_A)$, then $q(x+\delta) = \hat{c}_A$ for all $||\delta|| < R$. - To increase R, need to increase p_A . To increase

 p_A , get f to classify more noisy points to \hat{c}_A . $\overline{\text{Increasing the }\#\text{samples only slowly grows }R.}$

fuction PREDICT(f, σ ,x,n, α) $counts \leftarrow SampleUnderNoise(f,x,n,\sigma)$ $\hat{c}_A, \hat{c}_B \leftarrow \text{top two indices from counts}$

 $n_A, n_B \leftarrow \text{counts}[\hat{c}_A], \text{counts}[\hat{c}_B]$ if BinomPValue $(n_A, n_A + n_B, 0.5) \leq \alpha$: return \hat{c}_A

else: return ABSTAIN Notes: - Null hypothesis: true probability of success of

f returning \hat{c}_A is q=0.5BinomPValue returns p-value of null hypothesis, evaluated on n iid samples with i successes. - Accept null hypothesis if p-value is $> \alpha$

- Reject null hypothesis if p-value is $< \alpha$

- α small: often accept null hypothesis and AB-STAIN, but more confident in predictions. - α large: more predictions but more mistakes. inverse Gaussian CDF. Certified radius R de-

- Can prove that: PREDICT returns wrong class $\hat{c}_A \neq c_A$ with probability at most α 8.3 Generalizing Smoothing

on $\psi_{\alpha}: \mathbb{R}^d \to \mathbb{R}^d$, construct smoothed classifier: $g(x) := \arg \max_{c \in \mathcal{Y}} \mathbb{P}_{\epsilon}(f(\psi_{\epsilon}(x)) = c)$ where $\epsilon \sim \mathcal{N}(0, \sigma^2 \mathbf{I})$ and requiring composition $\psi_{\alpha}(\psi_{\beta}) = \psi_{\alpha+\beta}$. ψ is instantiated to geometric transformations.

9.1 Enforcing Fairness in Training $\phi(x,x') \equiv x \sim x' \ \phi(x,x') \Rightarrow M(x) = M(x')$ by some defn. of ϕ

9 Individual Fairness

Goal: $\max E_{x \sim D}[\forall x' \in S_{\phi}(x) : \mu(M(x), M(x'))], \text{ whe-}$ re $M = h_{\psi} \circ f_{\theta}$. Constraint on $f_{\theta} : \psi(x, x') \Rightarrow$

 $||f_{\theta}(x) - f_{\theta}(x')|| \leq \delta$, Train using DL2&PGD: $x^* = \arg\min_{x' \in S_{\Rightarrow}(x)} L(\neg(\phi \Rightarrow \omega))(x, x')$ 9.2 Certifying Fairness

Certificate: Let $z = f\theta(x), S_{\phi}(x) = \{x' \in$ $\mathbb{R}^d \mid \phi(x, x') \}$ and $\epsilon = \max_{x' \in S_{\phi}(x)} ||z|$ $|f_{\theta}(x')||_{\infty}$. Then $\forall y$. $y \neq y$

 $M(x), \max_{x' \in \mathbb{B}_{\infty}(z,\epsilon)} h_{\psi}^{(y')}(z') - h_{\psi}^{(y)}(z') < 0 \Rightarrow$

 $\forall x' \in S_{\phi}(x), \ M(x) = M(x')$ 10 Federated Learning
